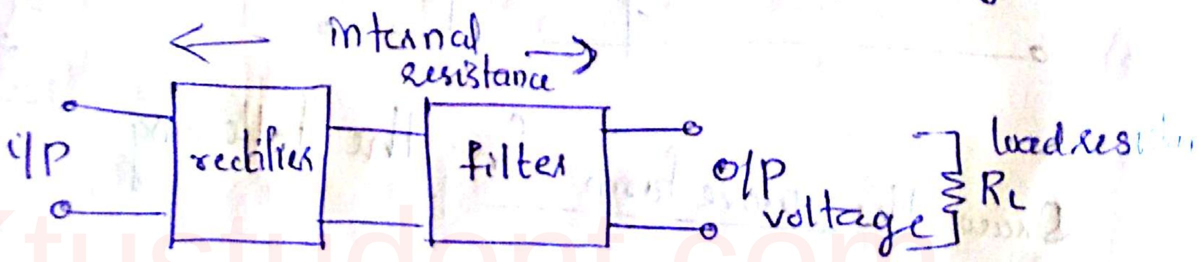
POWER SUPPLIES

MODULE - II

POWER SUPPLIES

1. Regulated Power supply
2. Unregulated power supply.

1) $\boxed{\text{Rectifier} \rightarrow \text{filter}}$: unregulated power supply.



disadv

1) According to R_L varies, V_o also varies.

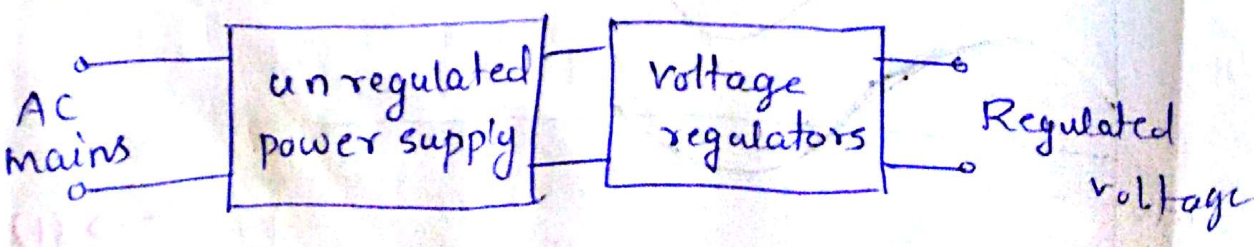
$R_L \uparrow \; V_o \uparrow$

$R_L \downarrow \; V_o \downarrow$

2) Fluctuation in i/p signal varies the o/p signal.

3) internal resistance.

Regulated Power supply

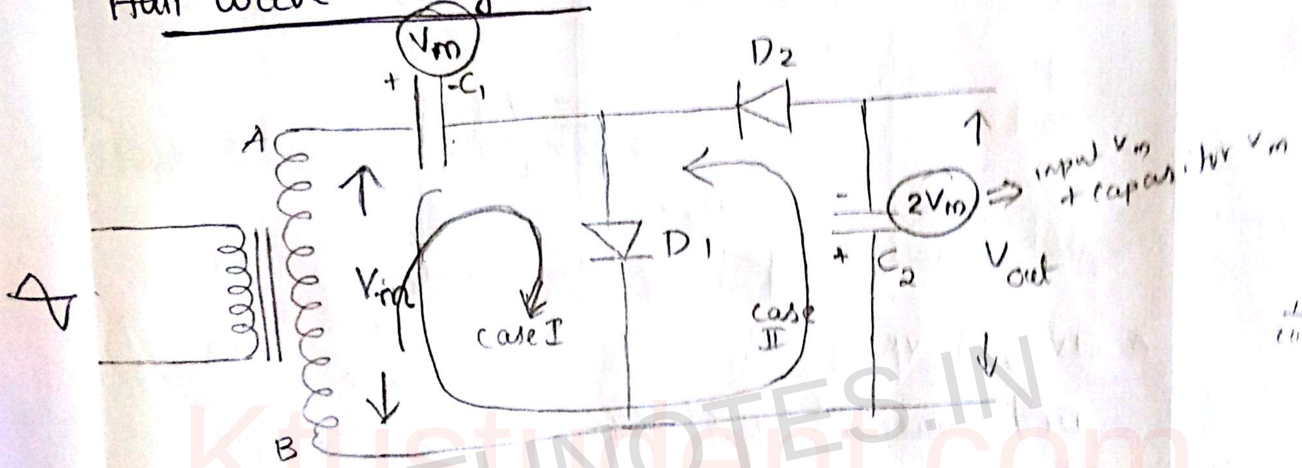


Voltage Multiplier

Voltage Doubler

→ Half wave voltage doubler
→ full wave voltage doubler

Half wave voltage doubler



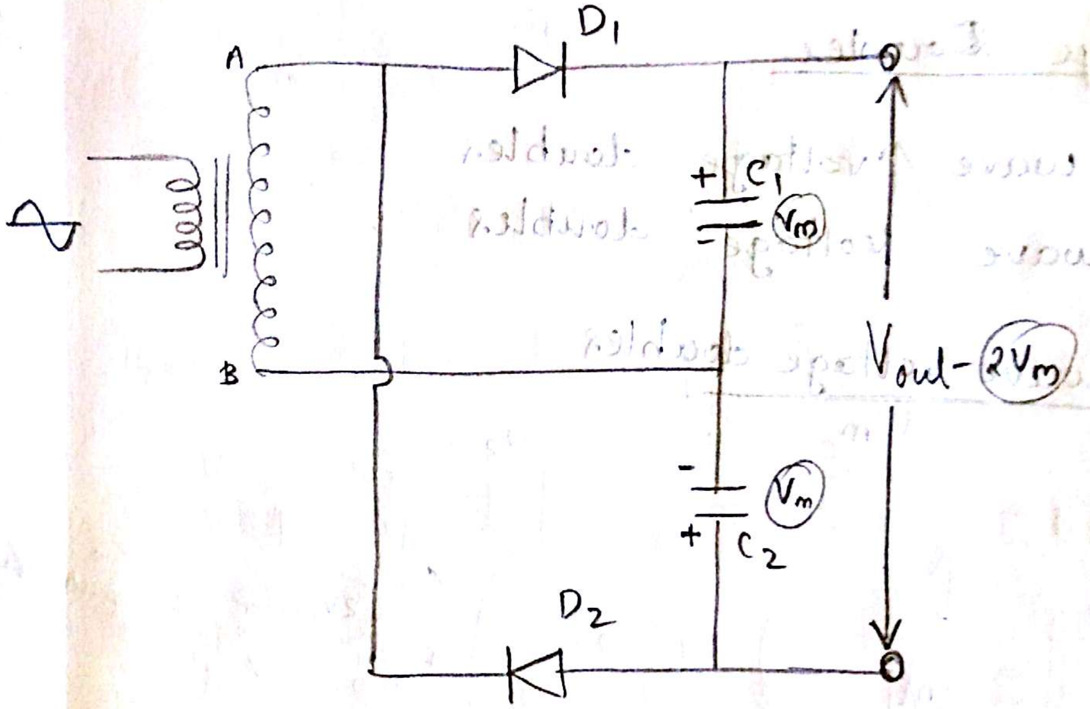
case I A : +ve, B -ve

D_1 → forward biased
D_2 → reverse , C_1 charges

case II A : -ve, B +ve

D_1 → reverse D_2 → forward , C_2 charges

Full wave voltage doubler



$A \to +ve$, $B -ve$

D_1 forward, C_1 charges

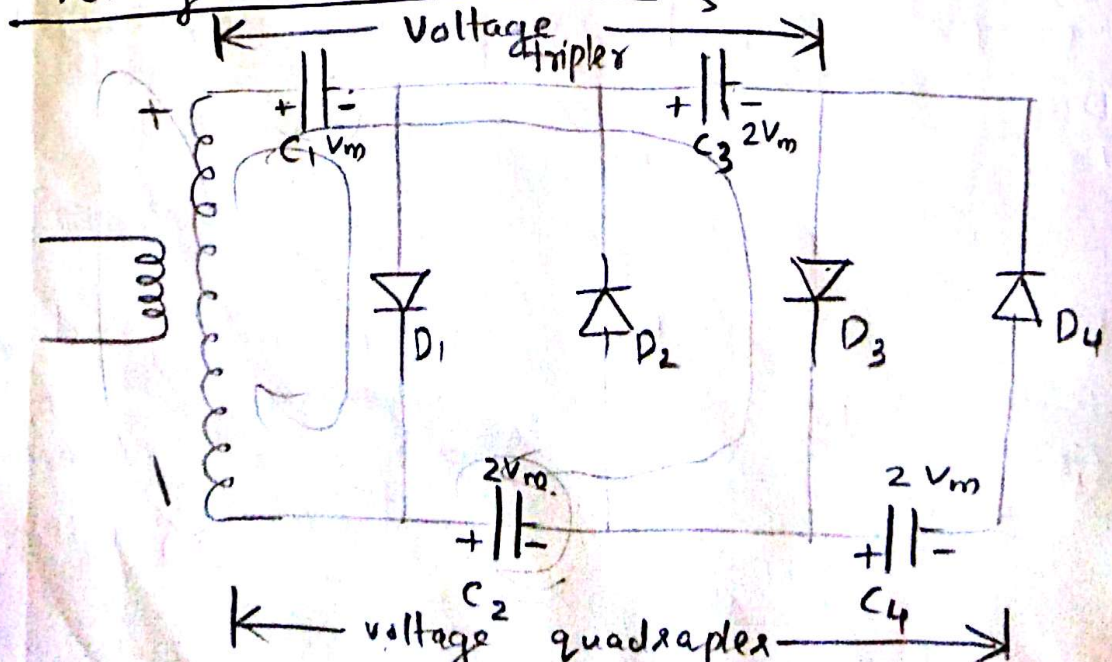
$A \to -ve$, $B +ve$

D_2 C_2 charges

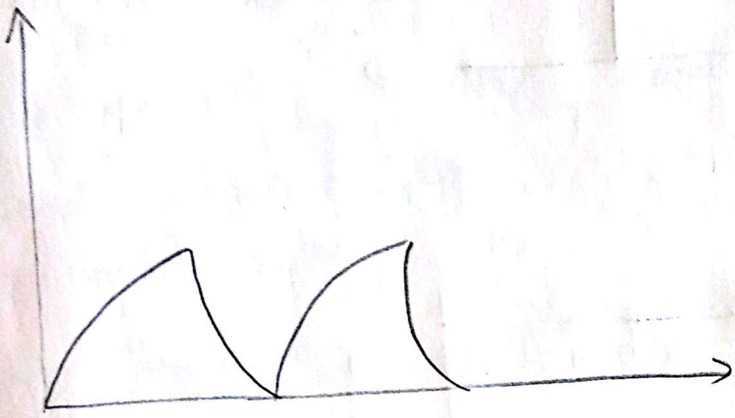
V_{out} across C_1 & C_2 ∴ $V_{out} = V_m$

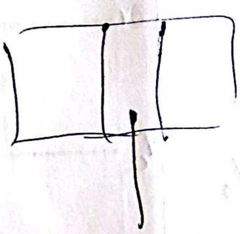
$V_m + 2V_m - V_m$

Voltage tripler Circuit

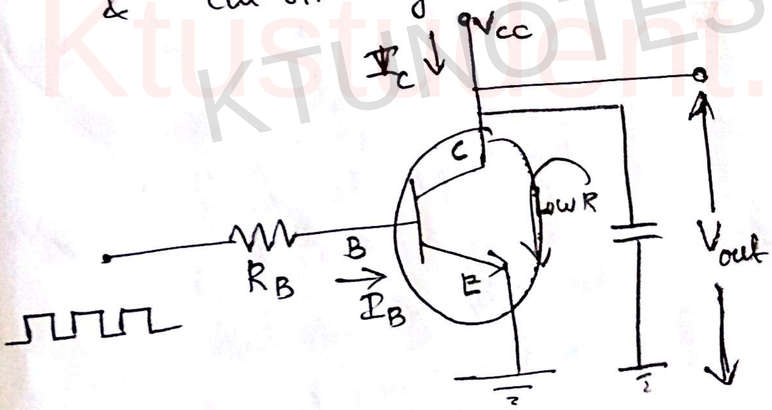


Sweep Circuit





Transistor works in
saturation region
& cut-off region in a sweep circuit



$$\frac{I_C}{I_B} = \beta$$

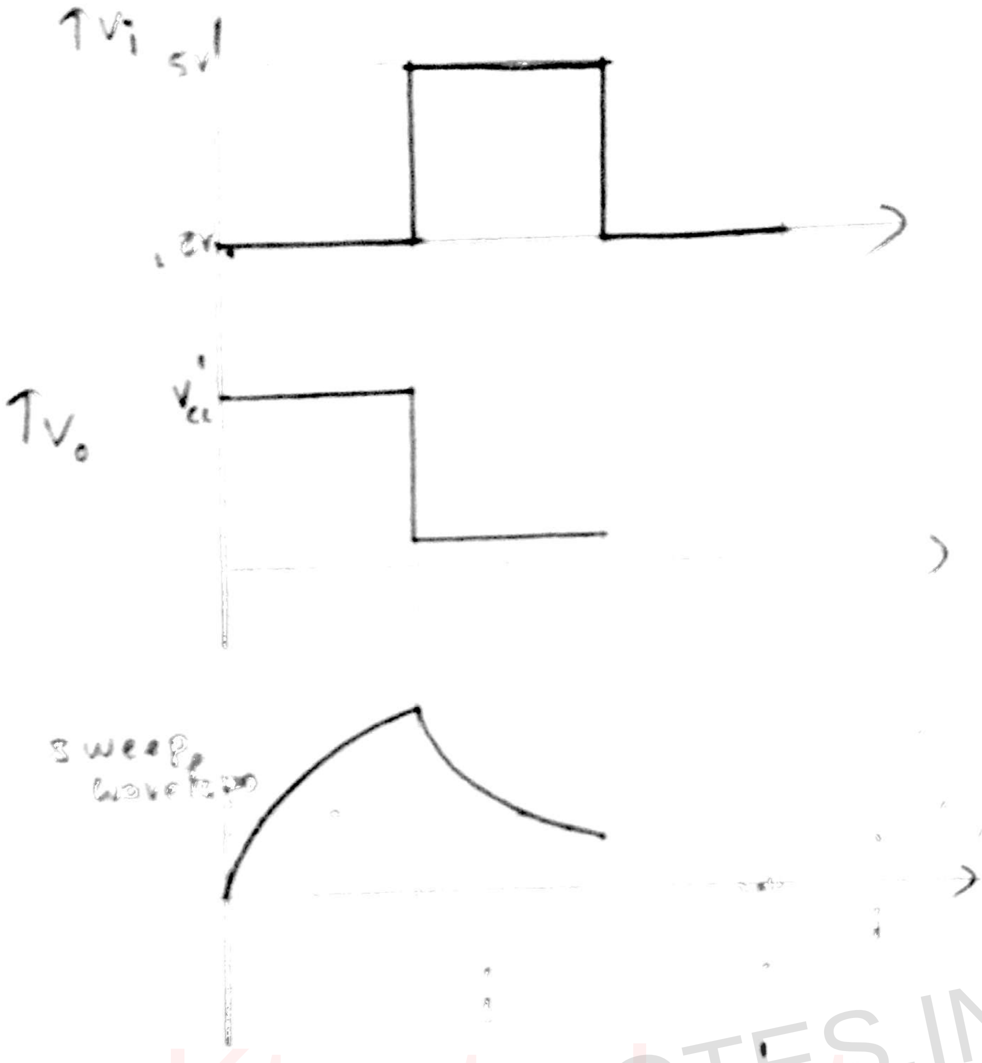
$$V_0 = V_{CC} - I_C R_C$$

when $I_B = 0$, $I_C = \beta I_B = 0$

$$\therefore V_0 = V_{CC} - 0 \times R_C$$

$$\underline{\underline{V_0 = V_{CC}}}$$

(3)



(4)

Series voltage regulator
Shunt voltage regulator

Characteristics of voltage regulator

1) Load regulation (LR)
2) Minimum (load) resistance R_{Lmin}
3) Lin Regulation or source regulation (SR)
4) output impedance
5) Ripple Rejection.

Load regulation (LR)

$$LR = V_{NL} - V_{FL}$$

V_{NL} - Voltage at no load
i.e., $R_L = \infty$

V_{FL} = Voltage at full load
i.e., R_L is minimum.

in ideal case $LR = zero$

Minimum Resistance (R_{Lmin})

It is the load resistance when load current is maximum.

$$R_{L(min)} = \frac{V_{FL}}{I_{L(max)}}$$

Line Regulation or Source Regulation

$$SR = V_{HL} - V_{LL}$$

V_{HL} = maximum source voltage

V_{LL} = minimum source voltage

$$SR\% = \frac{V_{HL} - V_{LL}}{V_{HL}}$$

Output impedance

Resistance offered by the circuit.

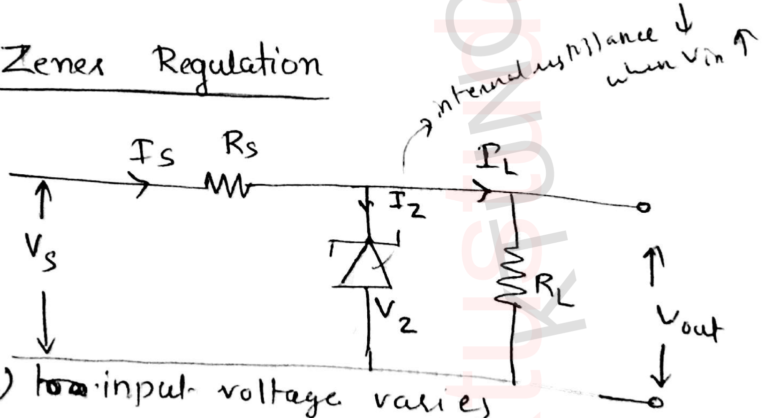
Ripple Rejection

ripples zero.

V_Z constant

$V_Z = I_Z \cdot R$

Zener Regulation



1) ~~load~~ input voltage varies

$V_{in} \uparrow$

$I_{S\uparrow} = I_{Z\uparrow} + I_L$ constant

$V_{in} \downarrow$

I_S

$I_L R_L$ = constant

$\therefore I_L$ is constant

2) R_L varies

$R_L \uparrow$

$$I_S = I_Z + I_L$$

$$\boxed{R_S = \frac{V_S - V_Z}{I_S}}$$

? For the circuit shown $R_S = 20\Omega$, $V_Z = 18$
$R_L = 200\Omega$. If V_{in} can vary from 20V
Find 1) The minimum & maximum curre
in zener diode

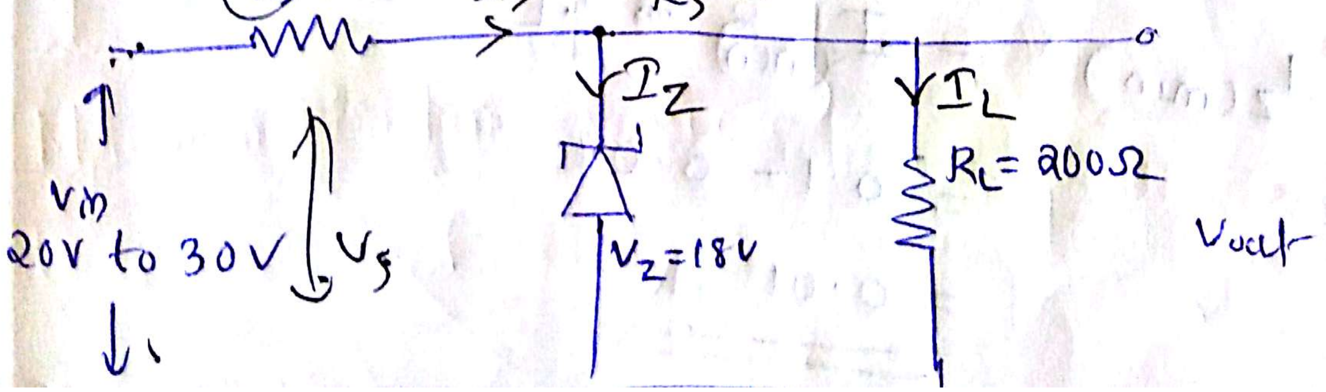
2) The min & max. power descipatted
diode

3) The maximum rated power descipa
that Rs should have.

$\frac{V_S - V_Z}{I_S}$

$I_S = I_Z + I_L$

$R_S = 20\Omega$ I_S V_Z $R_S =$



$V_{in(min)} = 20\,V$ $\quad R_S = 20\,\Omega$ $\quad V_Z = 18\,V$

$V_{in(max)} = 30\,V$ $\quad R_L = 200\,\Omega$

$$I_{S(min)} = \frac{V_S - V_Z}{R_S} = \frac{20-18}{20} = \frac{2}{20} = 0.1\ A$$

$$I_{S(max)} = \frac{V_S - V_Z}{R_S} = \frac{30-18}{20} = \frac{\cancel{12}}{\cancel{20}} = \frac{6}{10} = 0.6\,A$$

$$I_S = I_Z + I_L \Rightarrow I_Z = I_S - I_L$$

$$V_{out} = V_Z$$

$$\therefore I_L = \cancel{R_L \cdot V_{out}}\ \frac{V_{out}}{R_L} = \frac{\cancel{18}^{9}}{\cancel{200}} = 0.09\ A$$

$$= \cancel{200 \times 18 = 3600}\ A$$

$$I_{Z(max)} = I_{S(max)} - I_L$$

$$= \cancel{0.09} \ 0.6 - 0.09$$

$$= \underline{\underline{0.51\ A}}$$

$$I_{Z(min)} = I_{S(min)} - I_L$$

$$= 0.1 - 0.09$$

$$= \underline{\underline{0.01\ A}}$$

b) min power, $P_{min} = I_Z \cdot V_Z = 0.01 \times 18 = \underline{\underline{0.18\ W}}$

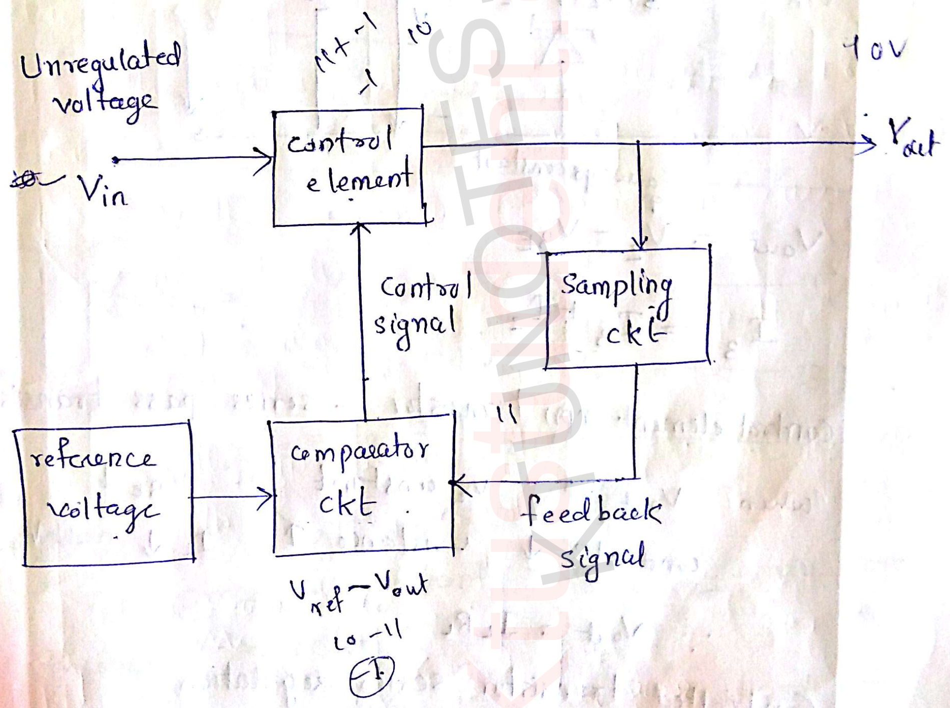
max power, $P_{max} = 0.51 \times 18 = \underline{\underline{9.18\ W}}$

$$P_s = I^2R = I_{s(max)}^2 \cdot R_s$$

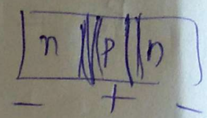
$$= 0.6^2 \times 20 = \underline{\underline{7.2\ W}}$$

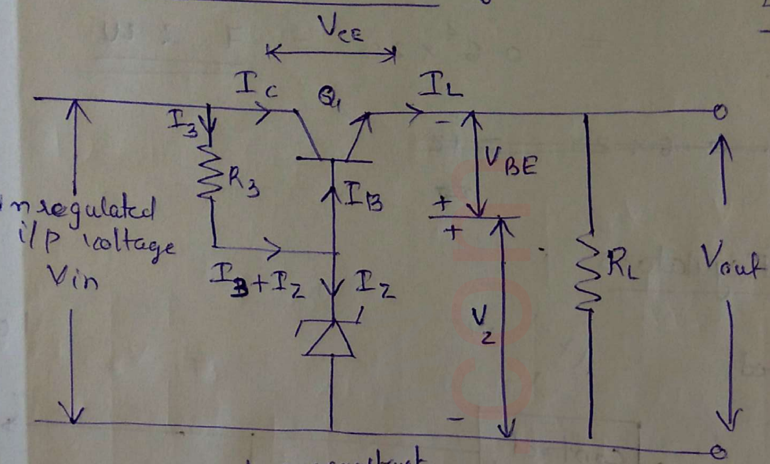
~~IV = 0.6 × 20 = 12~~

Series Regulators



Transistor Series Regulation





always constant

$$V_{out} = V_Z - V_{BE}$$

$$I_3 = I_B + I_Z$$

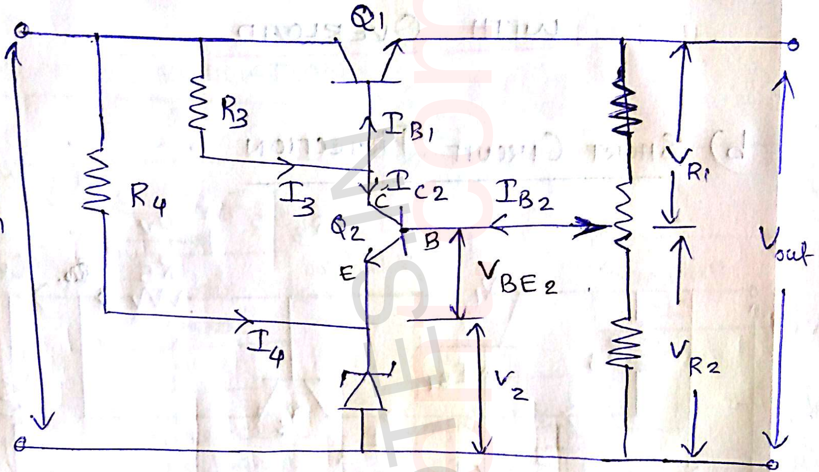
Control element npn transistor – series pass transistor

when $V_{out} \uparrow$ V_Z constant $\therefore V_{BE} \downarrow$

$\therefore$ conduct^n $\downarrow$ resistance $\uparrow$ $I_L \downarrow$ $\therefore V_{out} \downarrow$

$\because V_{out} = I_L R_L$

Controlled transistor series regulation



31/08/16

~~VRR~~ ≠ $V_{R2} = V_{BE_2} + V_Z$ —— (1)

$V_{out} = V_{R1} + V_{R2}$ —— (2)

$I_3 = I_{B1} + I_{C2}$ —— (3)

When $V_{out} \uparrow$, $V_{R2} \uparrow$

since V_Z constant $V_{BE2} \uparrow$, conduction

through transistor $\uparrow$. $\therefore I_{C2} \uparrow$.

since I_3 is almost constant

(3) ⇒ $\therefore$ acc. Acc. (3) $I_{B1} \downarrow$

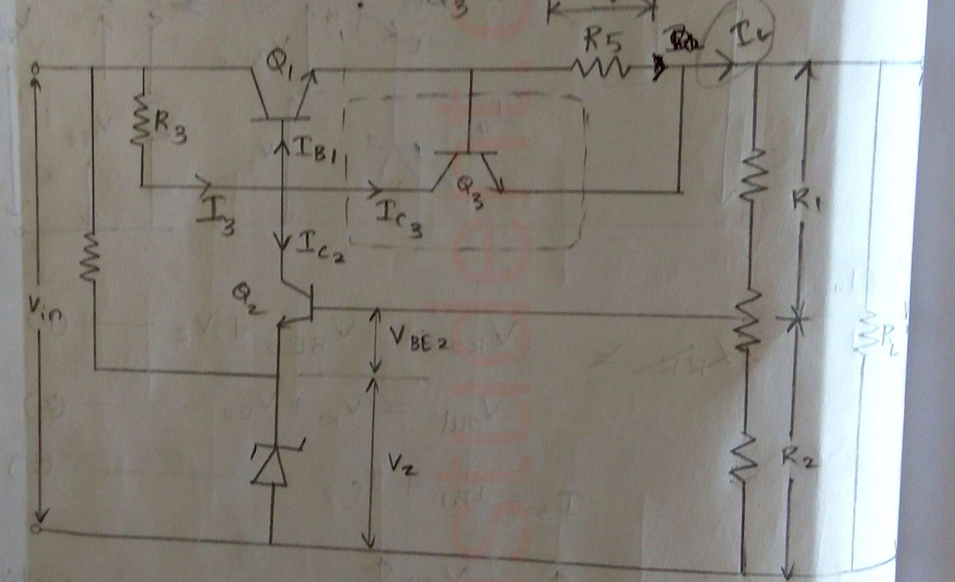
$\therefore V_{R1} \downarrow$

$\therefore V_{out}$ become constant.

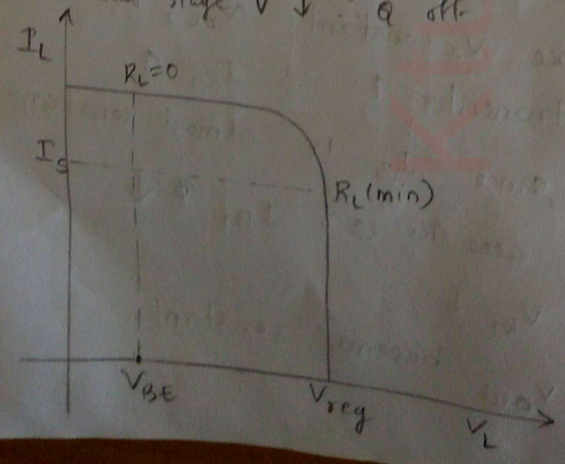
CONTROLLED TRANSISTOR SERIES REGULATOR WITH OVERLOAD

b) SHORT CIRCUIT PROTECTION

∴ Q_3 is only only when I_L is large

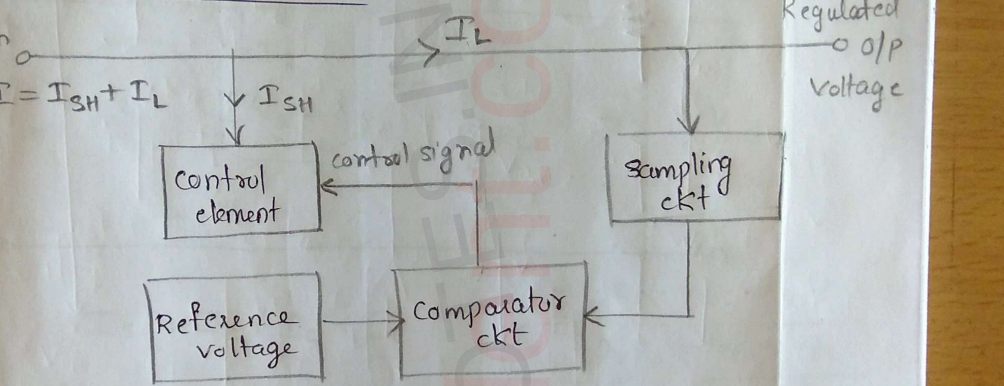


at normal state V ↓ ∴ Q off

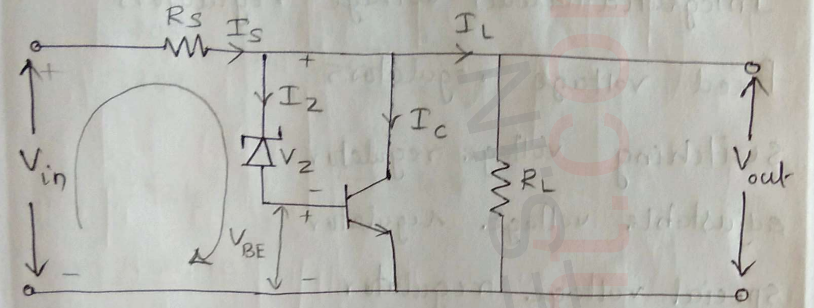


~~SHUND~~

SHUNT REGULATION



SHUNT REGULATION



$V_{in} - I_S R_S - V_Z - V_{BE} = 0$

$\boxed{V_{in} - I_S R_S = V_Z + V_{BE}}$

$$I_S = I_Z + I_C + I_L$$

$$V_{out} = V_Z + V_{BE}$$

$$= V_{in} - I_S R_S$$

$V_{in} \uparrow$

$V_{in} - I_S R_S \uparrow$

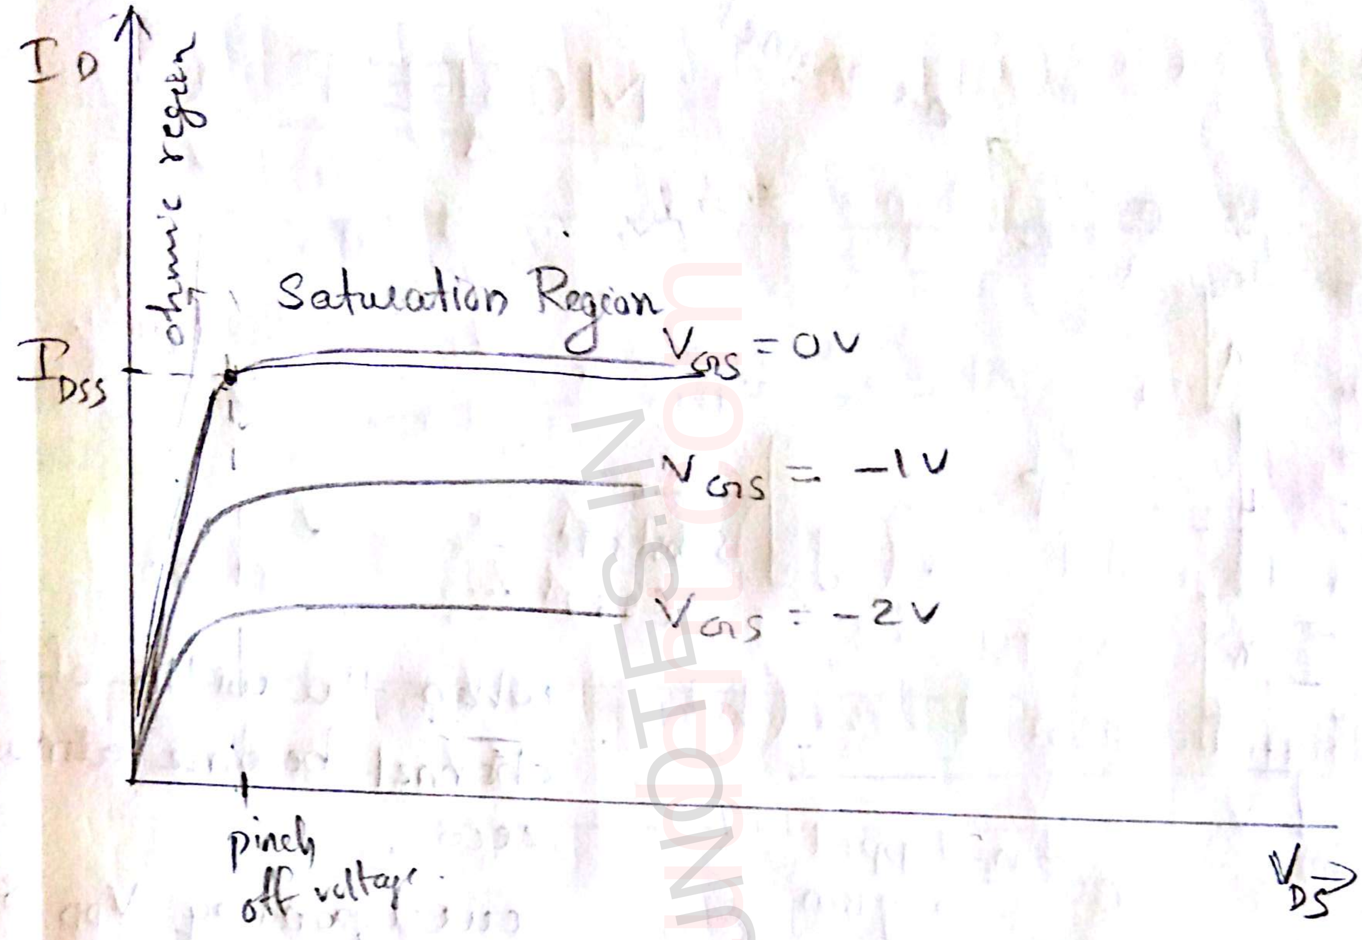
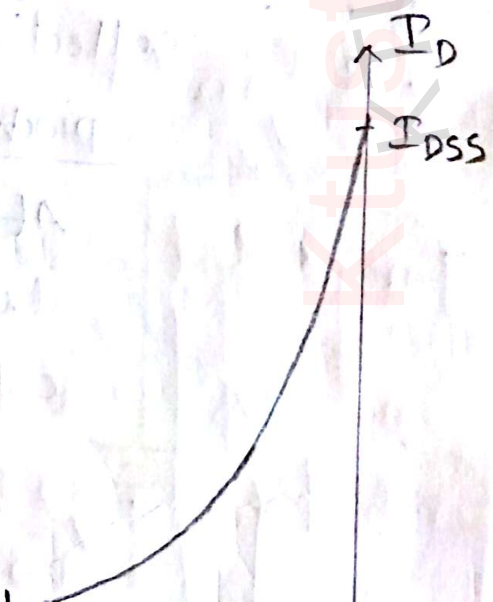
V= pinch off voltage





$I_D = I_{DSS}\left(1 -\right.$

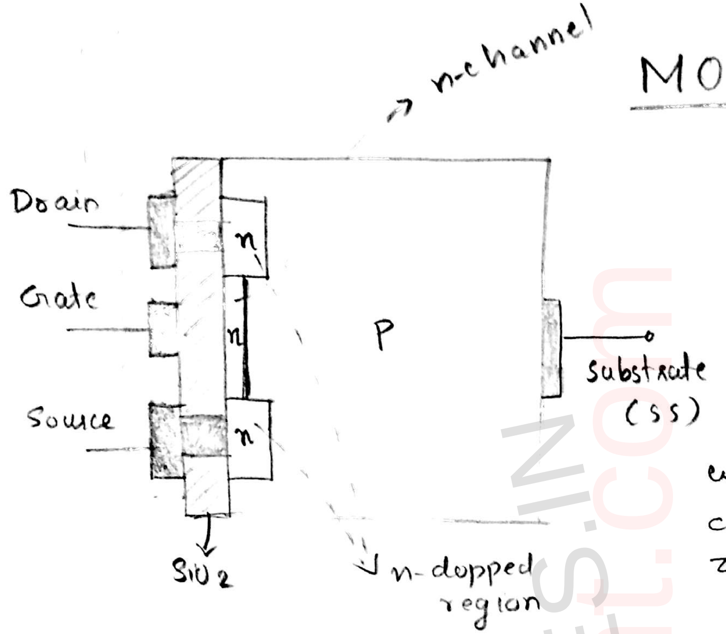
$V_{GS} = V_P$

$I_D = 0$

$V_{GS} = 0$

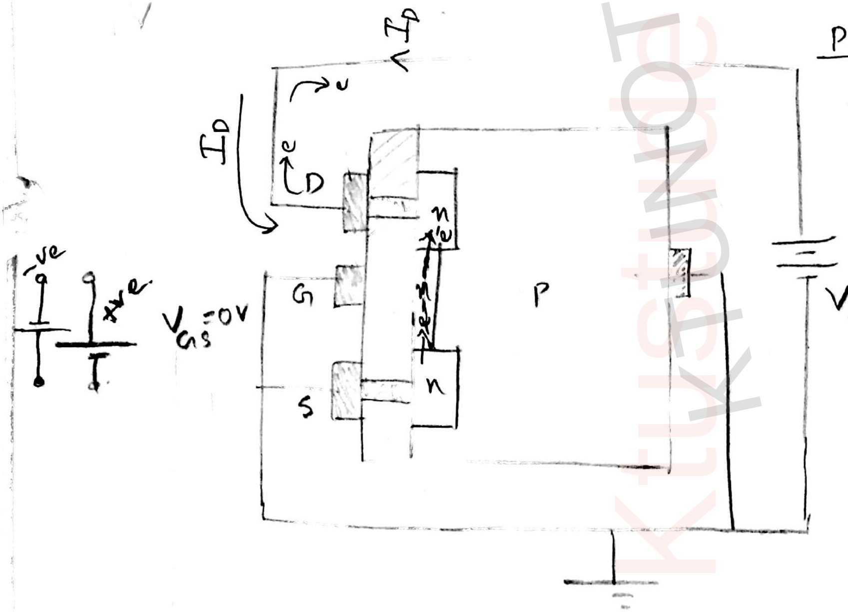
$I_D = I_{D}$

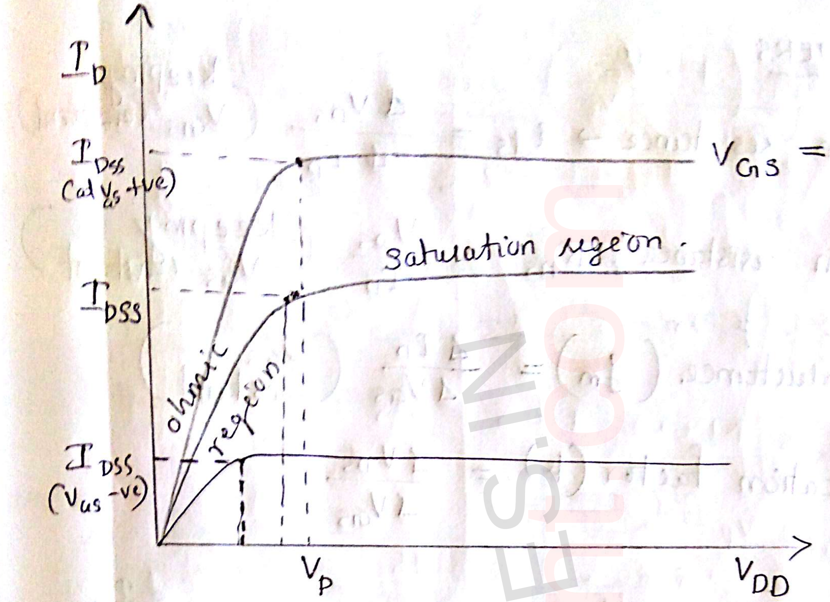
MOSFET



when the width of channel become almost zero, corresponding V_{DD} is called <u>pinch-off voltage</u> (V_p)

At that time; the drain current is called <u>saturation drain current</u> (I_{DSS})



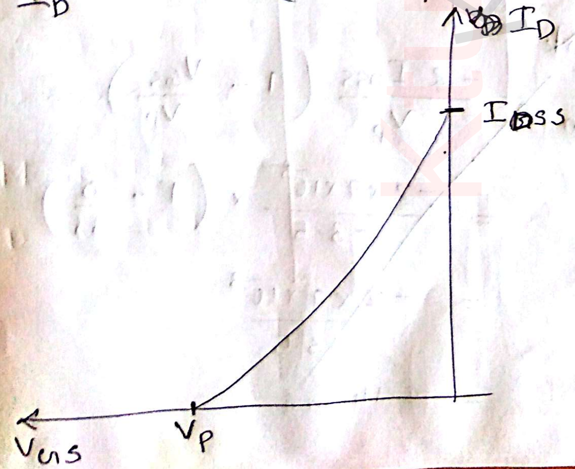


attract $\bar{e}$s from n and ~~ēs fr.~~ minority carriers ($\bar{e}$s) from p-type.

V_{GS} -ve

it pushes the electrons to p-region and majority carriers in p-region (holes) and these $\bar{e}$s combine. $\therefore$ $\bar{e}$s ↓ses $\therefore$ drain current ↓

$$I_D = I_{DSS}\left(1 - \frac{V_{GS}}{V_P}\right)^2$$



* PARAMETERS

1) AC drain resistance → $r_{ds} = \frac{\Delta V_{DS}}{\Delta I_D}$ (keeping V_{GS} constant)

2) DC drain resistance, $R_{DS} = \frac{V_{DS}}{I_D}$ (keeping V_{GS} constant)

3) Transconductance $(g_m) = \frac{\Delta I_D}{\Delta V_{GS}}$ (V_{GS} constant)

4) Amplification factor $(\mu) = \frac{\Delta V_{DS}}{\Delta V_{GS}}$

$d I_D$.

'~~Drain~~' Transconductance

$$g_m = \frac{-2 I_{DSS}}{V_P}\left(1 - \frac{V_{GS}}{V_P}\right)$$

$$\mu = g_m \times r_{ds}$$

1) Q. Given $I_{DSS} = 9mA$ and $V_P = -3.5V$. Determine I_D when $V_{GS} = 0V$ and $V_{GS} = -2V$

~~Drain current~~

$$g_m = \frac{-2 I_{DSS}}{V_P}\left(1 - \frac{V_{GS}}{V_P}\right)$$

$$= \frac{-2 \times 9 \times 10^{-3}}{-3.5} \times \left(1 - \frac{0}{-3.5}\right)$$

$$= \frac{-2 \times 9 \times 10^{-3}}{-3.5}$$

$$= 5.14\ mA$$

ans

$$g_{m(V_{GS})} = \cancel{\frac{-2 \times 9\times10^{-3}}{-3.5}} \left(1 - \frac{-2}{-3.5}\right)$$

$$= 1.$$

2) A JFET has pinch off voltage as $-1.5V$ $I_{DSS} = 10\,mA$ and $I_D = 2.5\,mA$. Determine the transconductance.

ans 1)

$$I_{D\,(V_{GS}=0V)} = I_{DSS}\left(1 - \frac{V_{GS}}{V_P}\right)$$

$$= 9\times10^{-3} \times 1 = 9\,mA$$

$$I_{D\,(V_{GS}=-2V)} = I_{DSS}\left(1 - \frac{-2}{-3.5}\right)$$

$$= 9\times10^{-3}\left(1 - \frac{2}{3.5}\right)^2$$

$$= \underline{1.65\,mA}$$

I_D

2)

$V_P = -1.5\,V$

$I_{DSS} = 10\,mA$

$I_D = 2.5\,mA$

$g_m =$

$$I_D = I_{DSS}\left(1 - \frac{V_{GS}}{V_P}\right)^2$$

$$1 - \frac{V_{GS}}{V_P} = \frac{I_D}{I_{DSS}} = \left(\frac{2.5}{10}\right)^2$$

$$= (0.25)^2 = 0.0625$$

$$\frac{V_{GS}}{V_P} = 1 + 0.0625 = \cancel{0.625}$$

$$= 1.0625$$

$$V_{GS} = V_P \times 1.0625$$

$$= -1.5 \times 1.0625$$

$$= -1.875$$

$$I_D = I_{DSS}\left(1 - \frac{V_{GS}}{V_P}\right)^2$$

ans
$V_{GS} = 2.25$

$$\left(1 - \frac{V_{GS}}{V_P}\right)^2 = \frac{I_D}{I_{DSS}} = \frac{2.5}{10} = 0.25$$

$g_S = 2.2\,mA$

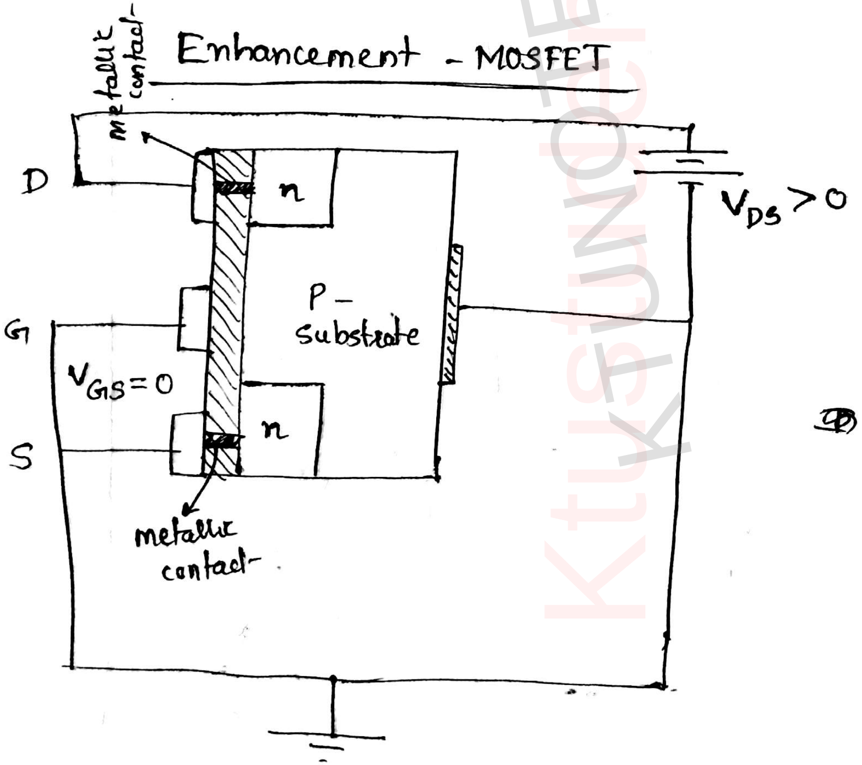
$$1 - \frac{V_{GS}}{V_P} = \sqrt{0.25} = 0.5$$

$$\frac{V_{GS}}{V_P} = \cancel{N+0.5}\ 1 - 0.5 = 0.5$$

$$V_{GS} = V_P \times 0.5$$

$$= -1.5 \times 0.5 = \underline{\underline{0.75}}$$

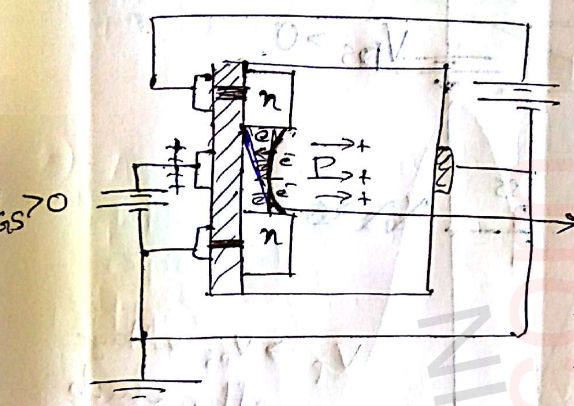
Enhancement - MOSFET



2.25

2.2 mA

$I_D = 0$



$V_{DS} = 5V$ (fixed)

channel formed

V_{GS} at which channel is formed, it is called threshold voltage (V_T)

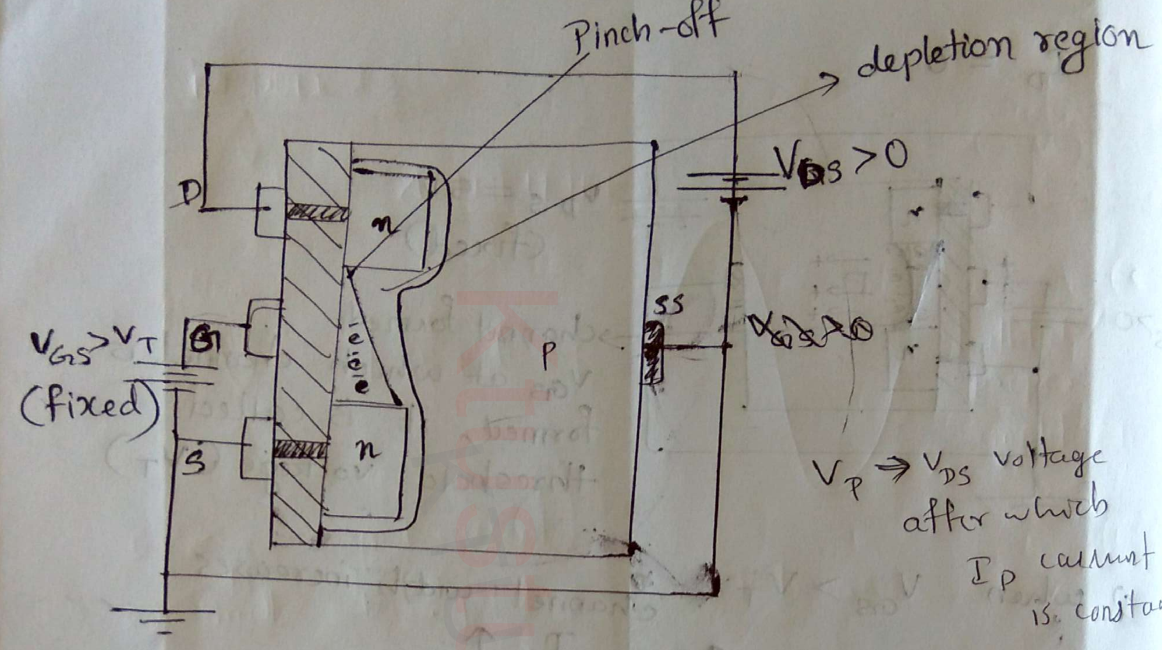
1) when $V_{GS} > V_T$, channel width increases

when V_{GS} increases, $I_D \uparrow$.

2) V_{GS} constant, channel width is constant ~~and $V_{DS} > 0$ increases~~. channel ~~width is~~

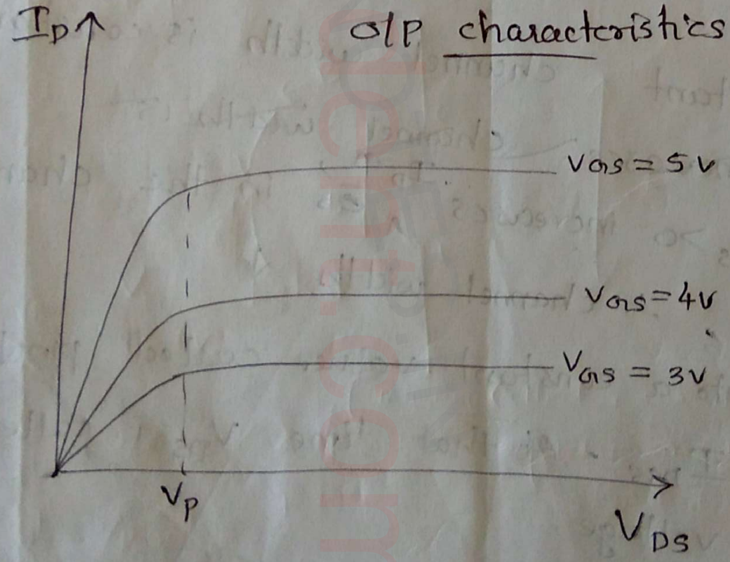
when $V_{DS} > 0$ increases, $I_D \uparrow$, $\bar{e}$s in the channel decreases, ∴ channel width ↓

$I_D \downarrow$ upto a constant value called pinch-off current I_{DSS}. At that time V_{DS} is called pinch-off voltage.

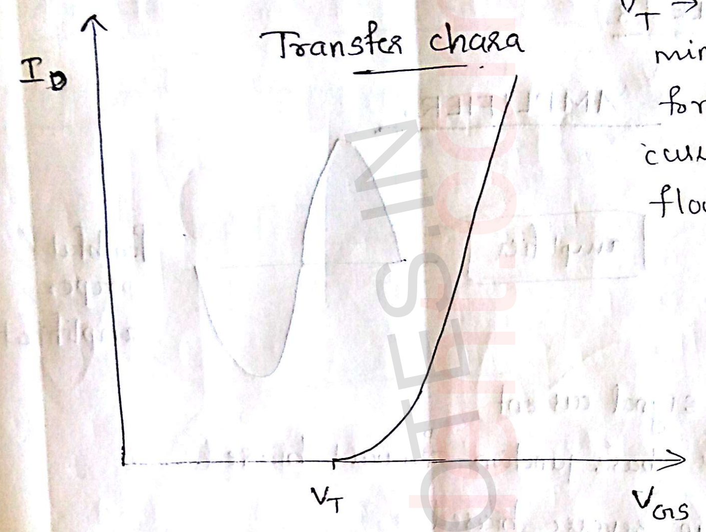


$V_P \Rightarrow V_{DS}$ voltage after which I_D current is constant

o/p characteristics



Transfer chara



$V_T \rightarrow$ threshold voltage
min. V_{GS} voltage for which I_D current starts to flow.

$$I_D = k(V_{GS} - V_T)^2$$

$$K = \frac{I_{D(on)}}{(V_{GS(ON)} - V_T)^2}$$

$$V_{GD} = V_{DS} - V_{GS}$$

In Enhancement MOSFET
Initially no channel. Enhanced $\bar{c}$s creating the channel. But in depletion MOSFET ~~the~~ the channel is already present.
